

Operating manual TR 360 - Archive document -

1. Function

www.ziehl.de

1.1 General

ZIEHL thermostats of the TR 360 series are electronic two-setpoint controllers for monitoring temperatures. The standard design of the temperature controllers model TR 360 is based on the closed-circuit current principle. The installed relays pick up with connected sensors.

The thermostat signals and switches when the set limit is exceeded.

Modern circuitry, reliable components such as function and routine test ensure high repeat accuracy and long service life.

TR 360 thermostats are built into a 24-pole plug-in housing:

- easy to operate and to install as directly wired to the plug base and the upper electronic part can easily be changed
- housing snapable on DIN-rail according to DIN EN 50 022 or mountable with M4 screws
- gold-coated contact springs and plugs ensure a perfect contact and a long service life.

1.2 Special Features of TR 360

Temperature controller for Pt 100 sensors according to DIN 43 760 / IEC 751

The TR 360 temperature controller monitors 3 Pt 100 sensors simultaneously. Each sensor has two adjustable limits. When the limit of early warning or switching off is exceeded in one of the sensors the relay that corresponds to the limit switches off. The TR 360 temperature controller has thus altogether 6 switching points, making it possible to represent many combinations of switch actions.

- 3 sensors, 6 adjustable limits, 2 relays
- LED display for operation ON, trouble in measuring circuit and switching state of the relays
- At sensor break or sensor short-circuit as well as at disconnection of sensor line the relays switch off. Signalled by LED display "Störung".

1.3 Application

TR 360 thermostats and Pt 100 sensors are a reliable monitoring system. For verifications at electromotors, generators or bearings the temperature characteristics and the temperature limits are an important measurable value. Possible damages by excessive temperature at machinery and equipment are effectively avoided:

- Exact temperature registration and exact switching with high repeatability
- largely insensitive to interference on measuring line

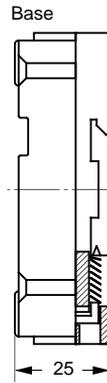

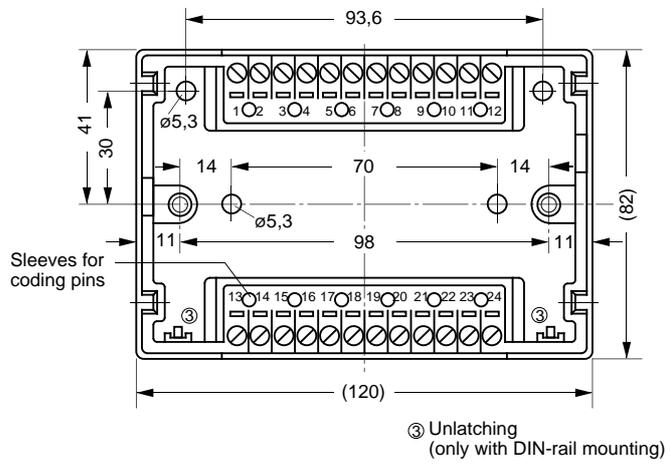

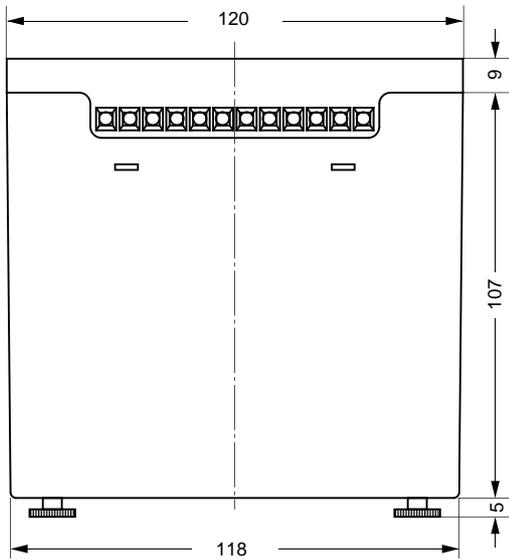

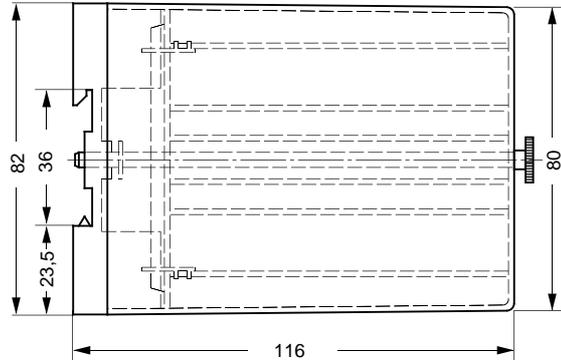

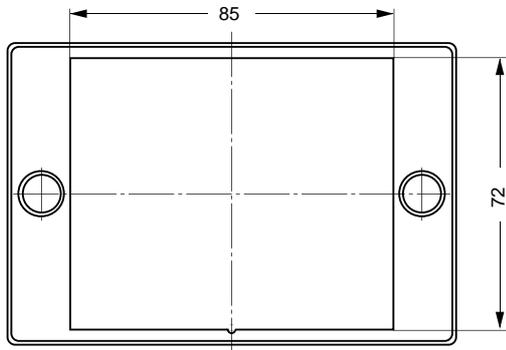

1.4 Compensation of line resistance

- connect pins 16-21 and 14-20
- connect sensor 1 to pins 18 and 22, short-circuit sensor line at sensor side (close to the sensor)
- set limit 1 to the value of the resistor for compensation (85 or 200 °C)
- turn trimmer for compensating line 1 until relay 1 switches, sensor line 1 is compensated
- make the same procedure for sensors 2 and 3
- disconnect short-circuits at sensor side
- connect sensors properly

2. Electrical Data

<u>Rated operational voltage</u>	see lateral type plate
Tolerance	+ 10 ... - 15 %
Power consumption	< 8 VA
Frequency	48...62 Hz
ON period	100 %
<u>Relay output</u>	2 relays
Switching voltage	max. AC 415 V
Switching current	max. 6 A
Switching power consumption	max. 1100 VA
Rated operational current	Ic = 2,5 A, 380 V , AC11
<u>Test conditions</u>	VDE 0660 / VDE 0160
Isolation	VDE 0110 / AC 380 V / I Group C
Transformer	VDE 0550
Permissible ambient temp.	-20 ... + 55 °C
<u>Housing</u>	design S - 24
Line connection	24 pole, 2 x 0,75 mm ² ... 1,5 mm ² per terminal
Housing protection class	IP 31
Terminal protection class	IP 20
Panel inclination	any
Mounting	snapable mounting onto DIN-rail 35 mm according to DIN 50022 or screwable assembly M4
<u>Sensor connection</u>	
Sensor	3 x Pt 100 according to DIN 43 760 / IEC 751
Sensor current	≤ 2 mA
Connection type	2 lines/sensor, compensation possible up to 20 Ohms
<u>Switching points</u>	6
Adjustment accuracy	approx. 3 degrees
Repetitive error	< 0,2 K
Switching state	standard: closed-circuit current principle true < set limit = relay on option: operating current true < set limit = relay off
LED Display	standard : true > set value = LED on option : true > set value = LED off
Hysteresis	≤ 2 % of span
Weight	approx. 830 gr

Design S24 :

Characteristic Temperature - Resistance Diagram for measurement resistors with platinum coiling

°C	0	10	20	30	40	50	60	70	80	90	Ω / °C
0	100,00	103,90	107,79	111,67	115,54	119,40	123,24	127,07	130,89	134,70	0,385
100	138,50	142,29	146,06	149,82	153,58	157,31	161,04	164,76	168,64	172,16	0,373
200	175,84	179,51	183,17	186,82	190,45	194,07	197,69	201,29	204,88	208,45	0,362
300	212,02	215,57	219,12	222,65	226,17	229,67	233,17	236,65	240,13	243,59	0,35
400	247,04	250,48	253,90	257,32	260,72	264,11	267,49	270,86	274,22	277,56	0,339
500	280,90	284,22	287,53	290,83	294,11	297,39	300,65	303,91	307,15	210,38	0,327
600	313,59	316,80	319,99	323,18	326,35	329,51	332,66	335,79	338,92	342,03	0,315
700	345,13	348,22	351,30	354,37	357,42	360,47	363,50	366,52	369,53	372,52	0,304
800	375,51	378,48	381,45	384,40	387,34	390,26					0,295

By a number of fixed point measurements the following interpolation function could be determined for the basic value series of measurement resistors with Pt coiling (DIN 43 760)

$$R_t = R_0 (1 + At + Bt^2)$$

R_0 = resistance at temperature 0 °C

R_t = resistance at temperature t (°C)

$$A = 0,390802 \cdot 10^{-2} \text{ (Grd)}^{-1}$$

$$B = 0,580195 \cdot 10^{-6} \text{ (Grd)}^{-2}$$

Thus any intermediate value can mathematically exactly be terminated, e.g.

$$t = 761,24 \text{ °C}$$

$$R = \frac{100 (1 + 761,24 \cdot A + 5,794863 \cdot 10^{-5} \cdot B)}{100 (1 + 2,974941 - 0,336215)} = 363,87 \text{ } \Omega$$

$$= 363,87 \text{ } \Omega$$
